## GoogleMaps coordinates:Latitude and Longitude in t

Posted by yaaqovb - 2007/04/11 21:49

---

First big tenx to all developers;)

How can I use

GoogleMaps coordinates:Latitude and Longitude in the Objects  
be great if i can add Latitude and Longitude ,,,

secand soory abut my english

1000 tenxs

yaaqov

---

there´s no need to fill in coordinates. You have to fill in the object address only. MisterEstate is fetching the coordinates then automatically.

---

yes,, but googlemap-address not work(yet) in my country(israel) ,googlemap work only satellite map..

is it way to insert coords instead object address ?:huh:

tenx

Hi

I had the same problem with addresses not being fully qualified and then not being found.

I used the District field to enter the coordinates in and changed the code to use that field only.

Add: `$geostuff = "$obj->district";`  
to `estateagent.php` and change the line:

---

```
$gmap->addMarkerByAddress($geostuff , 'This is a title', 'xxx');
```

hope this helps

---

Hello edrad80 can explain this exactly you?  
as I must them/her/it coordinates input?  
51.85104,8.32201 ? 51.85104/8.32201 ?

Thank you already once

Frank

It will very nice if we can use coordinates, what ever the reason we have.  
And it will very nice too if we can insert some objects like other google maps extensions.

sorry for my english

thanks!

```
the correct code is :  
$geostuff = "$obj->district";  
    $gmap->addMarkerByAddress($geostuff , "This is a title", "xxx");  
disable:  
//$gmap->addMarkerByAddress($address,"GMap Test","GMap Description");
```
