Hi,
first of all I would like to thank you for this great component and modules,
it works and looks very nice, but I have some suggestions for really needed features:

- 1)Search module - when you have hundreds of offers this is a must
It would be nice if there you can select property type,basic location,state,city(town,village),
min price,max price and so on as in advanced search
- 2)Upload for many pictures at a time, not just one - now it really takes a lot of time to
upload the pictures for these offers that have many pictures
(by the way what is the meaning of the new names of the pictures
I understand that they are renamed as they get in just one directory,but what the new names mean)
- 3)When agents log in from the front end :
-search by id for their properties (not working right now)
-translation of the offer title - not working
- 4)User defined fields with an option to be included or not in the search
- 5)Tooltips with pictures for most popular module
- 6)Random property module - it would be nice if we can select how many to be shown
and they can scroll up or down
- 7)Print function with an option of customising what to be included from the backend
visitors really need this
- 8)Something like shoping cart or favorites list but without logging
just for selecting interesting offers for later browsing
- 9)rss an send to a friend error - you are not authorized to view ...

:) that`s for now

I think the most needed features are search features - modules, more user friendly search links so they can be
added and used more - for instance:

www.properties.com/index.php?area=offers&type=0&location=5&town=2&minprice=10000&maxprice=20000

As I said before this is a great component and it deserve to be the best, I hope it would be

thank you for your work
