
Adding a URL in object description or misc.

Posted by Bertus - 2007/11/01 21:45

Hi,

Is there any particular reason (and maybe a fix) for this problem.

If a user adds an HTML link to the Description or Miscellaneous fields in the object, the tag is completely removed, only the text used to create the link is left when a user views the object.

`Link to my page `
ends being parsed to Link to my page when saved. Re-open the object for editing, the code is all intact, but the display only shows the text, as it appears when a user calls up the object. No link is created.

Any suggestions please?

Hi,

"`<a href=...`" tags are not allowed for users because of security reasons.
If you want to allow them, you'll have to edit line 354-363 in `user.estateagent.php`.
It should look like this then:

before:

```
strip_tags($obj->description,"<br />,,,,,<p>,</p>");
```

after:

```
strip_tags($obj->description,"<a>,</a>,<br />,,,,,<p>,</p>");
```

But on your own risk!
