
Constrain proportions does not work

Posted by breezy - 2007/06/28 11:58

Hi, the product is great but the system does not display images with their correct proportions. I have looked through the forum and from another post can confirm that my images are bigger than the sizes inputted in the config. Is there a way to fix this?

Best

Breezy :S

Same here... I started to ad pictures but the constrain proportions does not work... fist I tought that ok.. I just ad either vertical or horicontal pictures and thats it... but I realized after 3 objects that I do need both...

so anyone ??

I have just installed GD2 on the server and the quality of images is good - it's just the proportions are rigidly sticking to what is in the config and not constraining at all. Pleeeeaase help.

Thanks Nick

there should be a post variable submitted by the image upload form. Doesn't appear to be. You can change the following lines in upload.gallery.php :

line 50:

```
$cfg = 1;//(isset($cfg))? 1 : 0;
```

and line 56:

```
$cfg = 1;//(isset($cfg))? 1 : 0;
```

What you are doing is assigning the value of the variable manually and bypassing the missing value in the post request. This hardwires proportionality. You'd turn it off by setting the value to 0 instead of 1.

Hi there,

this is a known issue of the current version and will be fixed with the next release.

What you can do now is to pay attention that your pictures aren't smaller than your predefined size for pictures. Then it should work!
